RYO-CHAN Virtual Hackathon 2026 — Project Submission Form

> **Why this file exists.** The organiser's official form is linked from `GET https://app-ryochan.com/api/hackathon/config` as `https://ryobuild.com/project-submission-form.pdf`, but that URL does not serve a PDF. Checked again on 2026-09-06: `HTTP 200`, `content-type: text/html`, 2 034 bytes of the site's SPA shell (same for `MCP-Builder-Guide.pdf`; only the `.md` guide is a real file). The Help Desk has been asked for a working link. Until it arrives this form reproduces every field of the platform's own `HackathonSubmissionFields` schema (`PUT /api/hackathon/submission/draft`), so the committed answers match what will be submitted through the API.

field	value
`team_name`	Nota
`participant_name`	Pugar Huda Mantoro
`email`	hudapugar@gmail.com
`discord_id`	Lynx (hajislamet)
`github_username`	PugarHuda
`project_name`	Nota
`tracks`	`track_1`, `track_2`, `track_3`
`repo_url`	*pending* — organiser's private repo not yet issued; working mirror: https://github.com/PugarHuda/nota (private)
`demo_video_url`	https://nota-ryo.vercel.app/demo.mp4 (the 2-minute walkthrough, served by the project itself)
`x_post_url`	*pending post*
`agree_rules`	yes
`confirm_no_secrets`	yes — `.env` is gitignored, `.env.example` carries names only, `git grep` for `ryo_mcp_`, `tvly-`, `sk-or-v1-` and `VENICE_INFERENCE_KEY_` returns only placeholders and test doubles (verified 2026-09-06)

`project_description`

Nota makes an AI trading opinion auditable. Every decision is a receipt you can re-run: `nota replay <id>` rebuilds it from the stored evidence and cached model output and prints identical: true, so nothing can be rewritten after the fact. Each cited number carries its dotted RYO path and is read back out of the evidence, never retyped by the model; citations pointing at absent evidence are dropped in code; null is never turned into 0. Independent sources audit RYO itself - exchange medians check its price, Wilder RSI/ATR recomputed from public OHLC check its indicators - and the judge refuses to size a trade when they disagree. Three specialists (macro, technician, narrative) debate all six builder tools, weighted by their own Brier score once calls resolve. Track 3: four skills on RYO's own /api/skills paths, in RYO's envelope. Track 2: a dashboard that diffs each receipt against the last, ranked by impact. Read-only; no orders.

Evidence the judges can check without any key

- Two-minute captioned walkthrough: https://nota-ryo.vercel.app/demo.mp4
- Hosted dashboard: https://nota-ryo.vercel.app (read-only ledger snapshot, `/api/health` reports `ryo_key_set: false` — nothing is disguised as live).
- `NOTA_DB=data/demo.db uv run nota serve`, `uv run nota skill run price_crosscheck '{"symbol":"SOL"}'`, `uv run pytest -q` (112 tests, no network).

Declarations

- Read-only research tool. It never places, signs or routes an order; positions are paper only.
- No RYO builder key has ever been committed. Fixtures under `tests/fixtures/` are hand-built and labelled; nothing simulated is ever presented as live (`data_mode` is carried through and the risk layer refuses to size on `simulated`).
- Third-party libraries are disclosed in README under "Disclosed third-party libraries". All application code was written during the hackathon.
